SolCyber

Cloud Protection & Visibility

Introduction

With SolCyber, our Foundational Coverage service includes everything you need to immediately raise your security posture and stay resilient. This includes amazing humans running our 24x7 security operations center and a minimum effective dose of technology that provides protection across entire the kill chain.

However, for many of our customers, their most important assets reside in the cloud. Cloud has moved beyond a cheaper alternative to traditional infrastructure and has become the growth driver for the digital world.

Cloud Protection and Visibility

Cloud Protection and Visibility is the core service of our portfolio of cloud security extended services. Cloud is more than just storage or compute units – it's an additional environment to manage and protect. It's beyond threat detection, it's holistic security for the cloud.

1. **Continuous Assessment:**
    - Whether you use one or multiple cloud providers, you'll get full visibility.
    - We provide insight into excessive permissions, network exposure, misconfigured resources, sensitive data, and vulnerable workloads.

2. **Best Practice Policy:**
    - How good are your controls? Do they stack up to industry standards?
    - Get an understanding of how you compare to compliance standards such as CIS, SOC 2 and PCI, or against your own defined policies.

3. **Anomaly and Threat Detection:**
    - Are you actively under an attack?
    - Understand if there's reconnaissance activity, unauthorized configuration changes, or suspicious data access.

Most importantly our Cloud Protection and Visibility service is designed to be actionable:

- Alerts come with detailed step-by-step remediation instructions. They'll even come with least privilege policy recommendations for misconfigurations.
- When it comes to policies, you can't fix everything overnight, so we'll curate issues into easily prioritized remediation activity - even if you only have 10 minutes.

Cloud Protection and Visibility supports all three major cloud platforms: AWS, Azure, and GCP. It is priced based on resources used and is an add-on service to Foundational Coverage.
